

Abstract**Tube having thread orientation marks**

A tube has a first and a second thread orientation mark at respectively a first and a second extremity. The marks are each used for orienting a thread machined in an axial direction of
5 the tube. The first and the second mark are positioned relatively to each other such that a half line perpendicular to the centre axis, departing from the centre axis and passing through the first mark, when translated in a motion parallel to the centre axis towards the second extremity, at the second extremity departs from the centre axis and passes through the second mark.
